## Overview

---

APPA raised this concern in response to the Federal Energy Regulatory Commission's (FERC) 2018 rule allowing electric storage resources located on the distribution network or even behind a retail customer meter to participate in organized wholesale electricity markets without.

Distributed energy resources are advancing the cause of a more resilient and reliable power supply for utilities, homes and businesses, and more. Distributed energy resources (DERs) have become a major part of the power generation landscape, particularly in support of a more reliable and resilient.

Distributed Energy Resources (DERs) are small, modular energy generation and storage technologies that provide electric capacity or energy where it is needed. DERs can be technologies that generate and store power but can also be technologies or operator functions that manage how much and what kind.

Distributed energy resources (DERs) are small-scale units of power generation and storage located near the point of consumption. Unlike centralized generation systems that rely on large power plants and transmission over long distances, DERs provide power locally, offering greater flexibility and.

APPA supports federal regulatory policies under which DERs can only participate in wholesale electric markets with the consent of state and local regulators. In a shift from the traditional electric power paradigm, utilities and their customers are installing DERs, including distributed generation.

oving their flexibility. The establishment of a modern power system also faced major challenges. Such as how to achieving collaborative operation between the main grid, regional distribution networks, and distributed power generation and consumption devices, and how to improving the exhibil ty of.
