The lead-acid battery is a type of rechargeable battery. First invented in 1859 by French physicist Gaston Planté, it was the first type of rechargeable battery ever created. Compared to the more modern rechargeable batteries, lead-acid batteries have relatively low energy density and heavier.

When discharging and charging lead-acid batteries, certain substances present in the battery ( $\text{PbO}_2$ ,  $\text{Pb}$ ,  $\text{SO}_4$ ) are degraded while new ones are formed and vice versa. Mass is therefore converted in both directions. In this process, electrical energy is either stored in (charging) or withdrawn from the.

Cold cranking amps (CCA) is the number of amps the battery can deliver at  $0^\circ$  Fahrenheit for 30 seconds, while maintaining a voltage of at least 7.2 volts, for a 12 volt battery. The higher the CCA rating, the greater the starting power of the battery. All matching products will have a value greater.
